Veterinary Report

DANDENONG

19th December 2016

The above named colt was seen for a left hind lameness, grade 5/5.
Clinical examination found severe distension of the fetlock articulation and heat of the foot.

Radiographic images of the left hind fetlock were realized and show a sagittal fracture of the left hind proximal phalanx.

We placed a Robert-Jones bandage and started Metacam® intravenous injections for five days.

A radiographic control is recommended in one month: the 19th of January.

Dr Laurent Olivier on behalf of Michel Péchayre DVM
